## What's New With Nature's Spirit?

Here we go, what is new with Nature's Spirit? Well, we have added a brand new company to our line up that we are unveiling right in this newsletter. Because of this we have decided to have an emergency *Live On The Fly* this evening, at 6 PM Pacific time. This new line of product has taken Europe by storm, and moved onto US shores.

## FROZEN NORTH FLYFISHING

# FNF

*Pattern: The Wood Special*

If you are a fan of the Europeans and their style of fishing, you are going to love playing with **FNF** fly tying products. The majority of their material is based around making the **Blob Fly**, with a few different materials for other things. The **Blob**

**Fly** has become very popular in Europe, and it is showing up across the United States. But don't hold these materials to just a few patterns. They are very versatile and can be used for many different flies. We are going to take a few of these materials and go over the composition and structure, helping to define the best uses and applications for our favorite patterns.

## JELLY

**Jelly** is the main staple line from **Frozen North FlyFishing**. Out of 8 different styles, **Jelly** is the number one blob making material. It works like a synthetic hackle and a long fiber chenille. You can wrap it nice and tight for a blob fly, use it as a hackle on a small bugger, underbody on a larger bugger, a stack chenille for holding up a collar on an intruder, and the list just goes on. Each **Jelly** even has a different make-up giving each one a uniqueness of its own.

**Jelly Fritz** is the number one material of the jelly line up. It comes in three different sizes, meeting any size or need you have for this kind of product. They go as follows, **Jelly Fritz 15mm**, **Jelly 10mm**, and **Micro Jelly 6mm**. Now, what is so amazing about this product is the movement that it has in the water. Even when wrapped tightly together for a full thick body, Jelly has an incredible amount of movement, flaring out and pulsating back when pulled through the water. Then there's the colors, oh the colors. You will go blind from brightness if you put any **Jelly** under a UV light, which today we know is a benefit to our fly box, allowing for a stronger presence of color in low light conditions.

The other two **Jelly's** to look at are the **Block Jelly** and the **Slush Jelly**. **Block Jelly** is the sister of **Jelly Fritz**, mixed with a blend of Jelly Fibers and Opaque Fibers. The Opaque fibers

help catch more light off of the very colorful fritz fibers. As if **Jelly Fritz** didn't have enough color-refraction from the already bright material. The **Slush Jelly** is another blend that adds a different look to the **Jelly** lineup. **Slush Jelly** is a blend of the fine fritz fibers and a candy floss compound.

This gives it a slush-like appearance in the water, making a great egg chenille for streamers, or just a straight egg.

Now, what is the greatest benefit to a fly tier with this product is the core. All of the **Jelly** products are made with a micro core, allowing for a flexibility you will fall in love with when tying.

## CHEWING GUM WORM

No, this is not a material you can chew on like gum. It is for the fishes. **Chewing Gum Worm** is a chenille loaded with rubbery fibers for a real-worm like feel. This will revolutionize your worm patterns. It comes in a few different sizes starting at 3mm for your smaller work patterns, and jumbo 6mm for your up-sized worms and even shrimp bodies, yeah shrimp bodies. Think about it you salt fishers—a shrimp that has a nice gummy under body, it looks outrageously-amazing. Then there are wooly buggers and other streamer bodies you could use it for. You need to adapt **Chewing Gum Worm** to your box. But there is one more you should know about before you get started.

**Predator 9**, my favorite material from **FNF**. Now lets get on a personal level for a second. I love bass fishing, I mean love it. I grew up with a dad (Rueben Lamphere) who is a bass fanatic, and when we got our hands on this material we could not contain ourselves. Having a full range of color of this product to play with at our fingertips got us excited beyond belief. **Predator 9** is a brand new gigantic size of **Chewing Gum Worm**. The large worm patterns that you can tie are perfect for high water conditions on the river, a slow moving worm in the lakes, or a swimming worm in the salt water. Hello, tarpon fisherman. Glad you could join us. The beautiful part about this material line is that it's made with material that helps keep it somewhat buoyant. This allows for a slower sinking rate keeping our worm in the middle of the water column, right were a worm would be if stuck in the current. Or if you're like me and put a tungsten bead in the front, the tail will stick up off the bottom when you bottom-bounce a worm for bass. On top of that, think about the vibration the rubber gives off when you

I don't know about you, but we are way overly-excited about **FNF** reaching our doorsteps. This full product line is growing very quickly in popularity, and we cannot wait to see what all of you come up with in your fly tying adventures. Please share all flies with us on social media by tagging [@naturesspiritflytying](https://www.instagram.com/naturesspiritflytying) in your posts.

We will see you tonight night at 6 PM on Instagram for a full instructional on the **Predator 9** flies we have been tying along with the other products we are excited to have in our personal material selections.
